

Bob's Machine in Tampa Florida is leading the industry charge for a NMEA 2000 Jack Plate aka Transom Lift, connection. NMEA 2000 is a plug and play communication standard used for connecting marine sensors and display units. Bob's new NMEA adaptor will allow both old and new Bobs Jack Plates to connect to their Multifunction displays (MFDs) and view their jack plate height. In this time where boat dash's are getting more streamlined, some boats not even having gauges, this is a great feature to know your engines Jack Plate height!

Bob's has finished their engineering and is ready to release 2 versions, 1 for connection with a Bob's gauge, and 1 without a gauge (if only going to view via MFD).

As soon as our partners in the MFD industry have finalized software updates for the jack plates PGN, we will do any necessary software tweaks on our units and release to the public!

Bob's, leading the jack plate technology charge!
